Developed by the University of Colorado Boulder, this simulation allows users to explore how different environmental factors influence the survival and reproduction of organisms. By manipulating variables such as food availability, predator presence, and environmental changes, users can observe how populations evolve over generations.

Key Concepts Covered in the Simulation

The simulation covers several key concepts, including:

1. **Genetic Variation:** The simulation highlights how genetic differences within a population lead to variations in traits.
2. **Adaptation:** Users can see how certain traits become more common in a population as they confer a survival advantage.
3. **Environmental Pressures:** The simulation demonstrates how changes in the environment can drive natural selection.
4. **Speciation:** Over time, the simulation shows how populations can diverge into distinct species.

Answer Key for the PHET Natural Selection Simulation Worksheet

The worksheet accompanying the PHET Natural Selection Simulation is designed to guide users through the simulation, prompting them to make observations and draw conclusions. Below, we provide a detailed answer key to help you understand the concepts better.

Question 1: What is the initial population size in the simulation?

Answer: The initial population size is typically set to 50 organisms. This provides a sufficient sample size to observe changes over generations without being too unwieldy.

Question 2: How does the availability of food affect the population size?

Answer: The availability of food directly impacts the population size. When food is abundant, the population tends to grow as more organisms survive and reproduce. Conversely, when food is scarce, the population size decreases due to increased competition and lower survival rates.

Question 3: What happens to the population when a new predator is introduced?

Answer: Introducing a new predator typically reduces the population size as more organisms are preyed upon. Over time, the population may adapt by developing traits that make them less susceptible to predation, such as camouflage or increased speed.

Question 4: How does environmental change affect the population?

Answer: Environmental changes, such as temperature shifts or habitat alterations, can significantly impact the population. Organisms with traits that are advantageous in the new environment are more likely to survive and reproduce, leading to a shift in the population's genetic makeup.

Question 5: What is the role of genetic variation in natural selection?

Answer: Genetic variation is the raw material for natural selection. It provides the diversity of traits that allow some organisms to survive and reproduce better than others in a given environment. Without genetic variation, natural selection would not occur.

Tips for Using the PHET Natural Selection Simulation

To get the most out of the PHET Natural Selection Simulation, consider the following tips:

1. **Experiment with Different Variables:** Try changing multiple variables at once to see how they interact and affect the population.
2. **Observe Over Multiple Generations:** Natural selection is a gradual process. Observe the population over several generations to see the cumulative effects of environmental pressures.
