You can find the measure of an angle formed by two intersecting lines by using the properties of vertical angles and the fact that the sum of angles around a point is 360 degrees.

16	What is the difference between a congruent and a similar triangle?	Congruent triangles are identical in shape and size, meaning all corresponding sides and angles are equal. Similar triangles have the same shape but not necessarily the same size, meaning corresponding angles are equal, and corresponding sides are proportional.
17	How do you find the length of a side of a right triangle if you know the lengths of the other two sides?	You can use the Pythagorean theorem to find the length of a side of a right triangle. If you know the lengths of the two legs (a and b), you can find the hypotenuse (c) using the formula $c = \sqrt{a^2 + b^2}$. If you know the length of one leg and the hypotenuse, you can find the other leg using the formula $a = \sqrt{c^2 - b^2}$.
18	What is the formula for the area of a parallelogram, and what do the variables in the formula represent?	The formula for the area of a parallelogram is $A = \text{base} \times \text{height}$, where A represents the area, base represents the length of one of the parallel sides, and height represents the perpendicular distance between the parallel sides.
