Questions & Answers About 100 python interview questions and answers

No	Question	Answer
1	What are Python's key features that make it suitable for rapid application development?	Python offers features such as dynamic typing, automatic memory management, a vast standard library, and a simple, readable syntax, all of which contribute to rapid application development.
2	How does Python handle memory management?	Python uses a private heap space for memory management and incorporates a built-in garbage collector to recycle unused memory automatically.
3	Explain the difference between lists and tuples in Python.	Lists are mutable, meaning their contents can be changed after creation, whereas tuples are immutable, which makes them faster and suitable for fixed data.
4	What are Python decorators and how are they used?	Decorators are functions that modify the behavior of other functions or methods. They are used for logging, access control, instrumentation, and more, by wrapping another function.
5	How do you manage exceptions in Python?	Exceptions are managed using try-except blocks. You can catch specific exceptions, use else blocks for code that runs if no exceptions occur, and finally blocks for cleanup code.
6	What is the Global Interpreter Lock (GIL) in Python?	The GIL is a mutex in CPython that prevents multiple native threads from executing Python bytecodes simultaneously, limiting multi-threaded CPU-bound program performance.
7	Can you explain list comprehensions and give an example?	List comprehensions provide a concise way to create lists. For example, <code>[x*x for x in range(5)]</code> generates a list of squares from 0 to 4.
8	What are generators in Python and why are they useful?	Generators are functions that yield values one at a time, which is memory efficient for large datasets or streams compared to returning a full list.
9	Describe how Python's 'with' statement works.	The 'with' statement simplifies exception handling by encapsulating common preparation and cleanup tasks in context managers, ensuring resources like files are properly managed.

10	What is the difference between a list and a tuple in Python?	Lists are mutable, meaning their elements can be changed after creation, while tuples are immutable, meaning their elements cannot be changed once created.
11	How does Python handle exceptions?	Python uses try, except, else, and finally blocks to handle exceptions. The try block contains the code that might raise an exception, the except block handles the exception, the else block runs if no exception occurs, and the finally block always executes.
12	What is a decorator in Python?	A decorator is a design pattern in Python that allows behavior to be added to an existing object dynamically. Decorators are usually called before the definition of a function you want to decorate.
13	What is the purpose of the __init__ method in Python?	The __init__ method is a special method used for initializing newly created objects. It is called automatically when an object is created from a class and allows the class to initialize the attributes of the object.
14	How does Python manage memory?	Python uses a private heap containing all Python objects and data structures. The management of this private heap is handled by the Python memory manager, which includes a private heap allocator and a garbage collector.
15	What is the Global Interpreter Lock (GIL) in Python?	The GIL is a mutex that protects access to Python objects, preventing multiple threads from executing Python bytecodes simultaneously. This ensures thread safety but can limit the performance of multi-threaded programs.
16	What is the difference between deep copy and shallow copy in Python?	A shallow copy creates a new object but does not create copies of nested objects. A deep copy creates a new object and recursively adds copies of nested objects, resulting in a completely independent new object.
17	What is the purpose of the self parameter in Python?	The self parameter is a reference to the current instance of the class and is used to access variables and methods of the class. It is the first parameter of instance methods and is automatically passed when the method is called.
18	What is the difference between a class and an object in Python?	A class is a blueprint for creating objects, defining a set of attributes and methods that the objects created from the class will have. An object is an instance of a class, created using the class's constructor.
19	What is the purpose of the __str__ method in Python?	The __str__ method is used to return a string representation of an object. It is called by the str() function and the print statement, and it should return a string that is informative and easy to understand.
