8	How should a software engineer prepare for remote technical interviews?	Preparation includes practicing coding on shared editors, ensuring a stable internet connection, familiarizing oneself with video conferencing tools, and practicing clear verbal communication.

9	Can you explain the difference between a stack and a queue?	A stack is a data structure that follows the Last-In-First-Out (LIFO) principle, meaning the last element added is the first one to be removed. A queue, on the other hand, follows the First-In-First-Out (FIFO) principle, where the first element added is the first one to be removed.
10	How would you design a URL shortening service like Bit.ly?	Designing a URL shortening service involves several key components. First, you need a way to generate unique short codes for each URL. This can be done using a hash function or a counter. Next, you need a database to store the mapping between the short code and the original URL. Finally, you need a way to redirect users from the short URL to the original URL, which can be done using a web server and a routing mechanism.
11	Can you explain the difference between a class and an object in object-oriented programming?	A class is a blueprint or template for creating objects. It defines the properties and behaviors that the objects created from it will have. An object, on the other hand, is an instance of a class. It is a concrete entity that has its own state and behavior, as defined by the class.

1 2	How would you handle a situation where you have to work with a team member who is not contributing equally to a project?	In such a situation, it's important to address the issue openly and constructively. Start by having a one-on-one conversation with the team member to understand their perspective and any challenges they might be facing. Offer support and resources to help them contribute more effectively. If the issue persists, involve a manager or team lead to mediate and find a solution.
1 3	Can you explain the difference between a linked list and an array?	A linked list is a data structure where each element is a separate object that contains a reference to the next element in the sequence. This allows for efficient insertion and deletion of elements. An array, on the other hand, is a contiguous block of memory that stores elements of the same type. Accessing elements in an array is faster, but inserting or deleting elements can be slower.

1 4	How would you design a scalable web application that can handle millions of users?	Designing a scalable web application involves several key components. First, you need a robust backend architecture that can handle high traffic. This can be achieved using load balancing, caching, and database optimization. Next, you need a scalable frontend that can handle a large number of concurrent users. This can be done using techniques like lazy loading, code splitting, and server-side rendering. Finally, you need a reliable deployment and monitoring system to ensure the application runs smoothly.
1 5	Can you explain the difference between a primary key and a foreign key in a database?	A primary key is a column or set of columns that uniquely identifies each row in a table. It ensures that each row is distinct and can be used to reference the row in other tables. A foreign key, on the other hand, is a column or set of columns that references a primary key in another table. It establishes a relationship between the two tables and ensures referential integrity.

1 6	How would you handle a situation where you have to meet a tight deadline but are facing technical challenges?	In such a situation, it's important to stay calm and focused. Break down the problem into smaller, manageable tasks and prioritize them based on their impact on the project. Communicate openly with your team and stakeholders about the challenges you're facing and the steps you're taking to address them. Seek help from colleagues or mentors if needed, and be willing to adapt your approach as necessary.
1 7	Can you explain the difference between a synchronous and an asynchronous function in JavaScript?	A synchronous function is a function that executes sequentially, meaning it waits for the current operation to complete before moving on to the next one. An asynchronous function, on the other hand, is a function that can execute independently of the main program flow. It allows other operations to continue while waiting for the asynchronous function to complete, which can improve performance and responsiveness.

1 8	How would you design a recommendation system for an e-commerce platform?	Designing a recommendation system involves several key components. First, you need a way to collect and analyze user data, such as browsing history, purchase history, and user preferences. Next, you need an algorithm to generate recommendations based on this data. Common algorithms include collaborative filtering, content-based filtering, and hybrid approaches. Finally, you need a way to present the recommendations to the user in a way that is relevant and engaging.
